

Category 1 – Matter and Energy**STRUCTURE OF ATOMS**

matter: anything that has mass and takes up space
atom: smallest complete part (building block) of matter
element: substance made of only one kind of atom

Atom Part	Location within Atom	Atomic Mass	Electrical Charge
proton	nucleus	-1 amu	positive, +
neutron	nucleus	-1 amu	none, 0
electron	electron cloud	-1/2000 amu	negative, -

Example:
Lithium atom model shows 3 electrons, 3 protons, and 4 neutrons.

Not to scale

electron cloud: part of an atom surrounding the nucleus; consists mostly of empty space in which electrons move

nucleus: central part of an atom; contains most of its mass

IDENTITY AND PROPERTIES OF ELEMENTS

chemical symbol: element's abbreviation; first letter is capitalized and second letter (if it has one) is lowercase

Examples: Au for gold, O for oxygen, C for carbon, and He for helium

reactivity: chemical property that describes the likelihood and manner in which a substance undergoes a chemical reaction

valence electrons: outermost electrons in the atom's outer shell; an element's valence electrons determine its chemical properties (characteristics like reactivity and flammability)

atomic number: number of protons that an element has; determines the identity of an element; this number also equals the number of electrons in a neutral atom

PERIODIC TABLE

periodic table: chart that organizes elements based on similar properties; elements in the same **period** (horizontal row) have similar properties in order of increasing atomic number; elements in the same **group** (vertical column) have same number of valence electrons

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35	36	37	38	39	40	41	42	43	44	45	46	47	48	49	50	51	52	53	54	55	56	57	58	59	60	61	62	63	64	65	66	67	68	69	70	71	72	73	74	75	76	77	78	79	80	81	82	83	84	85	86	87	88	89	90	91	92	93	94	95	96	97	98	99	100
Period	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35	36	37	38	39	40	41	42	43	44	45	46	47	48	49	50	51	52	53	54	55	56	57	58	59	60	61	62	63	64	65	66	67	68	69	70	71	72	73	74	75	76	77	78	79	80	81	82	83	84	85	86	87	88	89	90	91	92	93	94	95	96	97	98	99	100
Group	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35	36	37	38	39	40	41	42	43	44	45	46	47	48	49	50	51	52	53	54	55	56	57	58	59	60	61	62	63	64	65	66	67	68	69	70	71	72	73	74	75	76	77	78	79	80	81	82	83	84	85	86	87	88	89	90	91	92	93	94	95	96	97	98	99	100

chemical formula: symbols and subscripts used to represent substances
subscript: number written below right of element's symbol in a formula; for each element, it shows how many atoms there are in each molecule; for the number 3, it means there are three atoms. It has 3 oxygen atoms and no hydrogen atoms. It is a molecule, but not an element.

molecule: substance made of two or more atoms

compound: molecule made of two or more elements

organic compound: compound that includes carbon along with the element(s) hydrogen, oxygen, nitrogen, phosphorous, and/or sulfur

PROPERTIES AND CHANGES

property: characteristic that helps one to identify or classify a substance

Property	Description	Examples
physical	can be observed without changing the substance	boiling point, state of matter (solid, liquid, gas), density (D)
chemical	observed when a substance reacts with a different substance	chemical reaction, flammability

Example: In the human digestive system, food is broken down into smaller pieces is a **physical change**; breaking down carbohydrates into simple sugars is a **chemical change**. Certain physical properties are used to classify common elements.

Type of Element's Physical Properties

metal	nonmetal	semimetal
shiny, good conductor, malleable (can be beaten into thin sheets); brittle	soft, some are conductors (metals and nonmetals); conducts heat slowly; some are gases in some conditions; along red line	metals and nonmetals

REACTIONS

chemical reaction: process in which the atoms of an original substance rearrange to produce a new substance(s); the new substance(s) has different properties from the original substance; reactions can be **exothermic** (produce heat) or **endothermic** (absorb heat)

source of a chemical reaction: color change, temperature change, evolution of gas, precipitation, or solid formation is often observed when a chemical reaction occurs

Example 1: $2\text{H}_2\text{O}(\text{liquid}) + \text{energy} \rightarrow 2\text{H}_2(\text{gas}) + \text{O}_2(\text{gas})$
This is a decomposition chemical reaction. The atoms in liquid water (H_2O) rearrange to produce hydrogen (H_2) and oxygen (O_2) gas molecules.

Example 2: $\text{H}_2(\text{liquid}) + \text{heat} \rightarrow \text{H}_2(\text{gas})$
This is not a chemical reaction. Water changes state from lower-energy liquid to higher-energy gas, but remains H_2O (no new substance is made).

CHEMICAL EQUATIONS

reactant: starting substance in a chemical reaction

product: final substance in a chemical reaction

law of conservation of mass: mass is neither created nor destroyed during an ordinary chemical reaction

$$\text{total mass of reactants} = \text{total mass of products}$$

coefficient: number placed in front of an element symbol or chemical formula; for the number 1, no coefficient is shown; multiply the coefficient by the element's subscript to find the total number of atoms

Example: There are 4 molecules of NH_3 in 4NH_3 , because the coefficient is 4. Each molecule of NH_3 has 1 atom of nitrogen (N) and 3 atoms of hydrogen (H). Therefore, 4NH_3 has 4 atoms of N and 12 atoms of H.

chemical equation: shows the number and kind of substances involved in a reaction; reactants are shown to the left of the arrow; and products are shown to the right of the arrow; a balanced chemical equation has an equal sign (=) between the reactants and products.

arrow: shows the direction of the reaction; a curved arrow has 6 O's on it.
